

Energy Services - Energy Monitoring & Management

The Bottom Line - Resource consumption is one of the largest factors affecting your profitability.

Whether you are in an industrial manufacturing or process environment, a mission critical arena such as health care, primary infrastructure or data centre, commercial or institutional property owner, reductions in energy costs and an increase in efficiency will help improve your overall performance and bottom line profitability.

The Issues - Facility Managers are asked to develop strategies for energy/resource savings, to understand capacity profiles, and eliminate system inefficiencies.

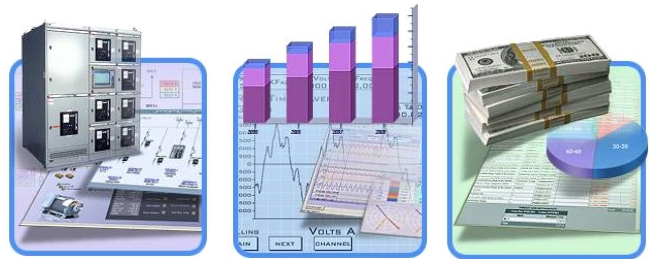

Whether your facility consumes Water, Air, Gas, Electric or Steam (WAGES) etc, the traditional source of energy cost information comes from the monthly utility bill. Although necessary information, the utility bill is often insufficient.

Analysis and resulting decisions based on insufficient information, produce disappointing solutions. In these cases, the information to make key business decisions, like the iceberg, is out of sight.

The Solution - An adequate Facility Energy System Audit and Analysis identifies the issues and defines the plans.

It's a plan not a project

An Audit and Analysis will determine the way forward and provide practical recommendations to show you how to reduce and control costs, optimize equipment utilization and improve your bottom line.

Our Engineering Professionals use their extensive domain and energy systems expertise to identify energy efficiency and cost reduction solutions.

Can-Technologies can:

- Conduct an On-site 'Energy Monitoring and Management' presentation
- Perform a Full Facility Energy System Audit and Analysis to suggest Energy Targets and determine needs
- Develop Effective Strategies and Action Plans to meet defined Energy Targets
- Provide Turnkey Project/Plan Management Resources
- Design, Install and Commission applicable Energy Monitoring and Management solutions
- Provide Management and User Training (Strategies, Plans, Technology and Analysis Tools)
- Provide On-going Maintenance Audits, Training and Technical Support of Protection, Monitoring and Analysis Systems
